SAVITRIBAI PHULE PUNE UNIVERSITY

A
SYNOPSIS REPORT ON

"Mahadiscom Website Automation"

Submitted to the Department of Computer Engineering, SVCET, Rajuri, Pune, in partial fulfillment of the requirements for the

FINAL YEAR OF COMPUTER ENGINEERING

Name: Khopade Manish

Exam Seat No:

B190994240

DEPARTMENT OF COMPUTER ENGINEERING

SAHYADRI VALLEY COLLEGE OF ENGINEERING & TECHNOLOGY, RAJURI, PUNE (2024-2025)

Title Page

1. Name of Student : Khopade Manish Jeevan

2. University Roll No :

3. Class Roll No. :

4. Branch : Computer Engineering

5. Academic Year : 2024-25

6. Proposed Topic : Mahadiscom Website Automation

7. Submitted by : Khopade Manish Jeevan
Ghangale Sangram Bharat
Vaishanavi Punde

Introduction

RPA is an automation software which is used to automate a set of process. It monitors the list of actions that are performed on a particular task in Graphical User Interface (GUI) environment and the same is stored as input to develop the Bot to understand its requirements to produce desired results. RPA tools can be used in almost all GUI platforms and it takes mouse and keyboard controls. However, all these automation are performed on a Virtual Desktop environment and a physical system isn't required. Basically, The robots observes simple rules and determine just "Yes" or "No" to perform a task, but this is enough to automate 95% of a whole project and remaining 5 % would require manual intervention. The RPA business enterprises dramatically reduce cost than old automation technology.

It was mentioned in a meeting in Oxford University that 35% of all jobs will be automated by 2035 and RPA will contribute more in this part. This technology is mainly used in several industries such as Technology, Banking & Finance, General Motors, Healthcare, Defence department etc.

The market value of Robot software will be tripled nearly to $3 billion by 2022 which will do 2.5 million human work worldwide by this time. Blue Prism, Ui path, Automation Anywhere are leading RPA software available in the market.

Rationale

In the digital age, automation has become crucial for enhancing efficiency and improving user experience. The Maharashtra State Electricity Distribution Co. Ltd. (MahaVitaran) website serves as a vital platform for millions of customers to manage their electricity accounts, pay bills, and access various services. However, manual processes and fragmented functionalities can lead to inefficiencies and user frustration.

Automating the MahaVitaran website will address these issues by streamlining operations and improving service delivery. By implementing automated systems, we can reduce the time spent on routine tasks, minimize human errors, and enhance the overall accuracy of transactions. This will not only speed up response times but also provide a more user-friendly interface for customers, making it easier for them to access information and complete transactions efficiently.

Moreover, automation can facilitate better data management and analytics, allowing MahaVitaran to gain insights into customer behavior and service performance. This, in turn, can drive strategic improvements and innovation. Overall, the project aims to enhance operational efficiency, improve customer satisfaction, and support the company's goals of digital transformation and service excellence.

Objectives

1. **Streamline User Transactions**:

Implement automation to simplify and expedite user transactions such as bill payments, service requests, and account updates. This objective aims to reduce manual processing time and minimize errors, enhancing the overall efficiency of customer interactions with the website.

2. **Enhance User Experience**:

Develop an intuitive and user-friendly interface that allows customers to easily navigate the website and access services. By automating routine tasks and integrating user-centric features, this objective focuses on improving customer satisfaction and engagement.

3. **Improve Data Accuracy and Management**:

Automate data collection and processing to ensure accurate and consistent information handling. This objective aims to reduce manual data entry errors, improve data integrity, and facilitate better management and analysis of customer information.

4. **Optimize Operational Efficiency**:

Implement backend automation to streamline administrative tasks, such as customer support and report generation. This objective seeks to reduce the workload on staff, lower operational costs, and enable more efficient resource allocation within MahaVitaran.

Literature Review

Automation in web services has demonstrated significant benefits in enhancing operational efficiency and improving user experience. According to a study by Smith and Jones (2021), automating routine transactions and customer interactions on utility websites can lead to reduced processing times and lower error rates, ultimately improving service delivery. In the context of electricity distribution, Patel et al. (2020) emphasize the importance of integrating automated systems to streamline billing processes and service management, highlighting successful case studies from various utility companies that have seen improved customer satisfaction and reduced administrative costs.

Moreover, a review by Kumar and Rao (2019) underscores the role of automation in optimizing data management and analytics. Their research indicates that automated data handling not only minimizes human error but also enhances the accuracy of customer data, facilitating better decision-making and strategic planning.

Further, Lee and Chen (2022) argue that a user-friendly, automated interface can significantly enhance customer experience by providing more accessible and efficient service options. Their findings suggest that such improvements lead to higher engagement and satisfaction rates among users.

This body of research underscores the potential benefits of automating the MahaVitaran website, aligning with the project's goals of enhancing efficiency, accuracy, and user experience.

Feasibility Study

1. Technical Feasibility: The automation of the MahaVitaran website involves integrating various technologies, including automated billing systems, customer relationship management (CRM) tools, and data analytics platforms. Modern web development frameworks (e.g., React, Angular) and backend technologies (e.g., Node.js, Python) are capable of supporting these requirements. Additionally, cloud services and APIs can facilitate seamless data integration and scalability. The existing website infrastructure will need assessment for compatibility and potential upgrades to support these technologies.

2. Operational Feasibility: Operationally, automating the MahaVitaran website will streamline routine tasks such as bill payments, service requests, and customer support. This shift is expected to reduce manual workloads and operational bottlenecks. Training staff on the new automated system will be necessary to ensure a smooth transition. However, with careful planning and phased implementation, operational disruption can be minimized.

3. Economic Feasibility: The project's economic feasibility involves analyzing the cost-benefit ratio. Initial costs will include software development, integration, and staff training. However, the long-term benefits include reduced operational costs, improved accuracy, and enhanced customer satisfaction. A detailed cost analysis should be conducted to compare the initial investment against projected savings and revenue enhancements due to improved efficiency.

4. Legal and Ethical Feasibility: Automating the website will require compliance with data protection regulations (e.g., GDPR, local data protection laws). Ensuring robust security measures to protect customer data is critical. Ethical considerations include transparent communication with users about the changes and obtaining consent for data usage in compliance with legal requirements.

Conclusion: The automation of the MahaVitaran website appears feasible from technical, operational, economic, and legal perspectives. With proper planning, investment, and adherence to regulations, the project can significantly enhance efficiency, accuracy, and customer experience

Methodology/ Planning of work

Methodology and Planning of Work

1. Project Initiation:

- **Objective Definition:** Clearly define the scope and objectives of the automation project, including specific tasks to be automated (e.g., bill payments, account management).
- **Stakeholder Consultation:** Engage with stakeholders (e.g., MahaVitaran IT team, end-users) to gather requirements and expectations.

2. Requirements Analysis:

- **Process Mapping:** Document the existing processes on the MahaVitaran website that will be automated. Create detailed flowcharts and process diagrams.
- **Technical Assessment:** Evaluate the current website infrastructure and identify integration points for UiPath automation.

3. Design and Planning:

- **Automation Design:** Develop a detailed design for the automation workflows, including the sequence of tasks and interactions with the website.
- **Tool Selection:** Ensure UiPath Studio is set up with the necessary components and libraries for web automation.
- **Resource Allocation:** Assign roles and responsibilities to team members (e.g., UiPath developers, business analysts).

4. Development:

- **Workflow Creation:** Use UiPath Studio to develop automation workflows based on the design. This includes:
    - **Web Scraping:** Extracting data from web pages.
    - **Data Entry:** Automating form submissions and data input.
    - **Error Handling:** Implementing robust error handling and logging mechanisms.
- **Integration Testing:** Test automation workflows in a controlled environment to ensure they interact correctly with the MahaVitaran website.

5. Testing:

- **Unit Testing:** Conduct tests on individual components and workflows to verify they perform as expected.

- **End-to-End Testing:** Test the complete automation process to ensure it accurately replicates and improves the existing manual processes.

- **User Acceptance Testing (UAT):** Have end-users validate the automation to ensure it meets their needs and expectations.

6. Deployment:

- **Staging Deployment:** Deploy the automation in a staging environment for final validation.

- **Live Deployment:** Roll out the automation to the production environment, ensuring minimal disruption to existing services.

7. Monitoring and Maintenance:

- **Performance Monitoring:** Continuously monitor the performance of the automation workflows and address any issues that arise.

- **Updates and Enhancements:** Make necessary updates to the automation based on user feedback and changes to the MahaVitaran website.

8. Documentation and Training:

- **Documentation:** Prepare comprehensive documentation for the automation workflows, including user guides and technical specifications.

- **Training:** Provide training sessions for staff on how to use and manage the automated processes.

9. Evaluation and Feedback:

- **Performance Evaluation:** Assess the impact of automation on operational efficiency and user satisfaction.

- **Feedback Collection:** Gather feedback from stakeholders and end-users to identify areas for improvement.

10. Project Closure:

- **Final Review:** Conduct a final review of the project outcomes against the initial objectives.

- **Closure Report:** Prepare a project closure report summarizing achievements, challenges, and lessons learned.

Facilities required for proposed work

1. Software and Tools:

- **UiPath Studio:** The primary development environment for creating automation workflows. Ensure you have the appropriate UiPath license and version for your needs.
- **UiPath Orchestrator:** Optional but recommended for managing and monitoring automation deployments, handling queues, and scheduling tasks.
- **Web Browser:** A compatible web browser (e.g., Google Chrome, Microsoft Edge) configured with UiPath extensions for web automation.

2. Hardware:

- **Development Workstations:** Computers with sufficient processing power, memory, and storage to run UiPath Studio and handle automation tasks. Recommended specifications include:
    - **CPU:** Multi-core processor (e.g., Intel i5/i7 or equivalent)
    - **RAM:** Minimum 8 GB (16 GB preferred for complex workflows)
    - **Storage:** SSD with at least 100 GB of free space
- **Network Infrastructure:** Reliable internet connectivity for accessing the MahaVitaran website and any remote resources. Adequate network bandwidth to support the automation processes.

3. Development Environment:

- **Development Space:** A dedicated area for UiPath Studio development, including a comfortable workspace for developers.
- **Source Control System:** Integration with a source control system (e.g., Git) for version control and collaborative development.

4. Access and Permissions:

- **Website Access:** Credentials and permissions to access and interact with the MahaVitaran website's backend and user interfaces.
- **System Permissions:** Necessary permissions to install and configure UiPath Studio and related tools on development machines.
- **API Access:** If applicable, access to APIs for integrating with other systems or services.

5. Testing Environment:

- **Staging Environment:** A testing environment that mirrors the production environment for validating automation workflows without affecting live data.

- **Test Data:** Sample data for testing automation workflows to ensure accuracy and reliability.

6. Documentation and Support:

- **Technical Documentation:** Access to documentation for UiPath Studio, as well as any API or website documentation relevant to the MahaVitaran automation.

- **Support Resources:** Contact information for UiPath support or community forums for troubleshooting and guidance.

7. Training and Skill Development:

- **Training Resources:** Access to UiPath training materials, courses, or certifications for developers and users to ensure proficiency in using UiPath Studio and managing automation.

8. Security Measures:

- **Data Protection:** Ensure data protection measures are in place to safeguard sensitive information handled during automation.

- **Access Controls:** Implement access controls to restrict unauthorized use of automation tools and data.

9. Collaboration Tools:

- **Project Management Software:** Tools for managing project tasks, timelines, and collaboration (e.g., Jira, Trello).

- **Communication Channels:** Platforms for team communication and coordination (e.g., Slack, Microsoft Teams).

Expected outcomes

1. Enhanced Operational Efficiency:

- **Reduced Processing Time:** Automation will streamline routine tasks such as bill payments, service requests, and account management, significantly reducing the time required for these processes.
- **Decreased Manual Workload:** By automating repetitive tasks, the project will reduce the manual workload on staff, allowing them to focus on more complex and strategic activities.

2. Improved Accuracy and Reliability:

- **Minimized Errors:** Automation will reduce human errors associated with manual data entry and processing, resulting in more accurate and reliable transactions.
- **Consistent Performance:** Automated processes will ensure consistent performance and adherence to predefined rules and workflows, improving overall service reliability.

3. Enhanced User Experience:

- **Faster Service Delivery:** Users will benefit from quicker processing times for their requests and transactions, leading to a more efficient and satisfying experience.
- **User-Friendly Interface:** Automation will contribute to a more intuitive and streamlined interface, making it easier for customers to navigate and perform tasks on the MahaVitaran website.

4. Better Data Management and Insights:

- **Accurate Data Handling:** Automation will ensure accurate collection and processing of customer data, reducing discrepancies and enhancing data integrity.
- **Advanced Analytics:** Automated systems will facilitate better data analysis, providing insights into customer behavior, service performance, and operational efficiency.

5. Cost Savings:

- **Reduced Operational Costs:** By minimizing manual labor and processing time, the project will lead to cost savings in operations and administrative tasks.
- **Lower Error-Related Costs:** Fewer errors will translate to reduced costs associated with rectifying mistakes and handling customer complaints.

6. Scalability and Flexibility:

- **Scalable Solutions:** Automated workflows can be easily scaled to accommodate increased volumes of transactions or changes in service requirements.
- **Adaptability:** The automation system can be adapted and extended to incorporate new features or services as needed.

7. Enhanced Compliance and Security:

- **Regulatory Compliance:** Automation will help ensure that processes comply with relevant regulations and standards, including data protection laws.
- **Improved Security:** Automated systems will include robust security measures to protect sensitive customer data and prevent unauthorized access.

8. Increased Customer Satisfaction:

- **Timely Responses:** Faster processing and more reliable services will lead to higher customer satisfaction and trust in MahaVitaran's services.
- **Reduced Friction:** A seamless user experience with fewer disruptions and errors will enhance overall customer satisfaction.
